

What is a Pallet Stacker Designed for?

A pallet stacker is a specialized type of forklift designed primarily for loading and unloading palletized goods on vehicles, and also to transport pallets from one location to another. The equipment is constructed with heavy-duty, rugged material with the intention of being able to withstand extreme weights and heavy daily wear and tear. Its basic components include a pair of forks which can be slid underneath a pallet for lifting to a desired height. Depending on how the stacker is being powered, its engine compartment may house hydraulic, electronic or gas-run devices.
